                Dataset:  V:\RIECE DATA\RIECE_RELEASE V3-2017-2018/codebook\a3_run.dta
              Last saved:   4 Mar 2024 17:29
                         DATA HAVE CHANGED SINCE LAST SAVED

                  Label:  [none]
    Number of variables:  276
Number of observations:  1,182
                   Size:  4,550,700 bytes ignoring labels, etc.
          Unique Values:  A list of all of the possible non-missing values
                          for the variable and the description of the values.
 Unique Missing Values:  There are four types of missing values

              .a or RF: The subject explicitly refused to answer the question
                        when he or she should have.
              .b or NA: The subject was never asked the question
                        for one reason or another. Usually this results
                        from "skip patterns" that occur.
              .c or DK: The subject was unable to answer the question
                        either because he or she had no opinion or because
                        the required information was not available.
              .d or MI: Items should be filled out but have no data entry found.
                        This is enumerator's own mistake. The circumstances
                        can be interviewers failing to ask a question
                        or forgetting to record a response

      Numeric Missing*:   .a                    String Missing*:   RF
                          .b                                       NA
                          .c                                       DK
